Essay: Value of water

There is a saying that "Thousands have lived without ~~love~~ love, but not one without water," it clearly indicates the fact that water, above all is the only source through which functions and forms all units that exist on this earth.

There are seven planets in our solar system, yet, only one supports life. (ie earth)

Therefore, in my opinion, it's safe to say that water is the only reason behind earth being the only planet to support life. Nature has endowed the world with great unique beautifeness, amongst them all, water is the best gift, it is the most essential resources of the world.

Almost two-third of the earth's surface is filled with water, but 97% of it is not fit for human consumption, yet 3% has it

all for the consumption of oneselves.
It is limited, though it's enormous
and abundant, it is also used in many
other ways that undergoes human, plant
and all living creatures, it's usefulness
is beyond our explanation.

Earth only will function with the presence
of water and thus, if there wasn't any
water on this earth, the greeneries we see
now will all turn into barren lands and
would end up in an endless summer with
no more seasons felt left. Henceforth, water is
also known as the giver of life.

On the other hand, human race would end up
without the existence of water, the same can
be faced by aquatic life if undergoes such
dreadful times for it is their habitat,
their birthplace. Without its abundant offerings,
an aquatic life of animals ranging from
a small insect to the biggest whale will
also starve the same, it is also termed as
the key to a "happy and ~~healthier~~ healthier life."

Moreover, when we talk about our personal lives, we consume a lot more than what we expect. Almost 60% of our body is made up of water and overall, we won't be able to live for three to five days without water. As the saying goes "There is plenty of water in the universe without life, but nowhere is there life without water," indicates that though there are plentiful of resources in this universe, water is still its necessity.

Also, emergence of life based on agriculture, industries and manufacturings also consumes a large deal of water for its functionalities like our body needs it for our day-to-day life's processes. You might have heard the scenarios of water depleted countries like Africa where people leads a very miserable life, but we still keeps on wasting it, we are never to understand the real importance of water unless we are to face the scare of it. As mentioned, if the world or you and I don't work for the conservation

of water, then the world we think now is safe will suffer its ultimate demise then we can even imagine of.

In instance, the Ganga river of India which is also considered as the holy river is now at the worst of its pollution, people contaminate it with every Carbage possible, they don't realise that future generations will suffer of what they does in the present.

Nevertheless, we celebrates 22nd of March as "World Water Day" since 1993 for the importance and to spread the usefulness of water, it was first termed to celebrate by the United States.

Besides all odds in life, water tends to be the most and the more important resources. Life without water is impossible, it's hard to believe but 'the water present today on this earth is the same 5 billion years ago'. It's our duty to save or destroy it after nature has gifted us with everything possible. Therefore, we need to pledge on the usefulness of it on the generations will hear its melancholy cry. Remember, No Water. No life. No blue. No green.
